ABSTRACT

Urethral stricture is constriction of the urethral partition because the presence of scrape tissue and contraction. There is some factors that be the cause of it, such as congenital factor, inury, and infection. Painful micturition and deficiency of micturition flow was the most clinical sign that can showed. The aim of this research was to know the effectiveness of nursing care for urethral stricture patients. This reserch uses case study analysis that refers to nursing intervention at nursing care room. Based on the result of the research, the majority of the respondent is male. Uroflowmetry and urinalysis is the best choice to show the level of the urethral stricture , and the purpose of the therapy is to get the permanent recovery with the options of the urethral therapy is urethral dilatation and stent-set. Respondents in this study amounted to two patients. The conclusion is occurless of the urine elimonation pattern and acute pain. In suggest for nurses to be improve giving a holistic nursing care for urthral stricture patients to get permanently recovery.
