

ABSTRACT

ALI SATI SIREGAR. *The Correlation Between Stage Of Communication With Distance of Crude Palm Oil (CPO) Producers To Jakarta Future Exchange (JFX)*. The objection of this study is to find whether there is correlation between stage of communication with distance of CPO producers to JFX.

The data of stage communication and distance of producers are found from the answers of questionnaires that distribution of the member of Indonesia Palm Oil Producers Association (GAPKI). The distribution of questioners is accompanied by the letter that signed by the Chairman of GAPKI and the collection of the responds is carried out through the office of GAPKI. The data are tabulated and analysed their normality with the method of Chi Square statistic. The Hypothesis of stage of communication is examined with parametric statistic with t test procedur. The hypothesis of correlation between stage of communication with distance of producers is examined with non prametric statistic. i.e. Coeficient of Contingency procedure.

It is found that the stage of communication is low. The palm oil producers only know the existence and function of JFX, but do not understand the mechanism of activities and unable to participate JFX. The Distance affects the stage of communication.

From the result of the research it is concluded that stage of communication between JFX and producers is low and the farther the dstance the lower the stage of communication is.

JFX is necessary to socialize its existence, benefit and mechanism of work and also to mke ists location nearer or establish ists representation around the location of producer.
