#### **ABSTRACT**

CKD patients often experience problems with fluid overload which can cause other health problems and can even lead to death. The final scientific work aims to identify fluid management methods in CKD patients on the 6th Floor of the Darmawan Pavilion Presidential Hospital in Gatot Soebroto Hospital in 2018. Writing scientific papers using a case study method on 5 clients, in the form of comprehensive nursing care. The results show a reduced manifestation of fluid overload on the client, proving that the method is effective enough to deal with fluid overload in CKD clients. It is recommended that nurses be able to provide guidance or health counseling about the importance of limiting fluid intake and how clients control fluid intake, as well as being able to identify the causes of not being able to control fluid intake while at home with clients with CKD
