Title : Review of Completeness of Writing Out Causes of Internal Injuries Support the Accuracy of Injury Coding Due to Traffic Accidents at the Persahabatan Center General Hospital

In the coding of injuries due to a traffic accident, it cannot be separated from the injury code and the code of the cause of the injury. Injury coding due to traffic accidents is utilized for the purpose of completing a system for reporting morbidity and mortality applied by healthcare care facilities as well as traffic reporting statistics to the police. Completeness of writing of external causes of injury is necessary for the coding of external causes of injury. The purpose of this study was to find out the description of the completeness of writing the causes of injury and the accuracy of the coding of injuries due to traffic accidents at RSUP Persahabatan. This research method is a descriptive method with a sample of 86 medical records. Data collection techniques by observation and interview. The results of the study were 67 medical records (77.9%) written outside causes of injury while 19 medical records (22.1%) were not written outside causes of injury, 48 medical records (55.8%) were right in the coding of injuries and external causes of injury, while 38 medical records (44.2%) were not properly encoded, with details of 19 medical records (22.1%) because doctors did not write out external causes of injury, and 19 other medical records (22.1%) because the coder was not right in coding. Factors that affect the inaccuracy of the injury coding due to traffic accidents are the lack of understanding of doctors and coder due to the absence of a policy or SPO specifically for coding injuries due to traffic accidents. It is recommended that the MIK RSUP Persahabatan Hospital disseminate the procedures for carrying out the coding of traffic accident cases, in order to complete the patient's medical record in full to support code compliance.

Keywords: *External causes of injury, injury code, external cause of injury code*
