*Title : Review of Outpatient Patient Registration Information System at the Muhammadiyah Taman Puring Jakarta Hospital in 2019*

*Outpatient registration is the initial service provided by the hospital to patients. The registration of outpatients at the Jakarta Puring Muhammadiyah Hospital Jakarta is already computerized based on the website. The general objective of this research is to review the information system that is in the Outpatient registration section so that the constraints found at the registration site can be minimized. The research method used is descriptive qualitative analysis. Data collection techniques by observation and interview. From the results of the study, the Hospital has registered computerized patients on a website-based basis, using an application called Avicenna created by Muhammadiyah Hospital Taman Puring Jakarta and working with vendors. Avicenna application still has obstacles that often arise, one of which is to search for old patient data that does not carry a medical treatment card that has been carried out in accordance with the rules of the Medical Record, which only includes the date of birth, but at Muhammadiyah Hospital, Taman Puring, Jakarta, there are still duplicate patient data when searching for patient data based on date of birth. Therefore it is recommended for the Jakarta Puring Muhammadiyah Hospital Jakarta to always evaluate when the network is having problems.*
