

## **ABSTRACT**

*Title : Analysis of Completeness of Filling in Clinical Electronic Medical Records at Cipayung Public Health Center 2020*

*Name : Gita Sari*

*Study Program: Diploma III Medical Record and Health Information*

*Medical records are an important part of assisting in the implementation of service delivery to patients at Public Health Center (Puskesmas). The medical record is used as a reference for the next patient, the patient's medical record must be ready when the patient is treated again. Completeness of filling out medical records by health workers will make it easier for other health workers to provide action or therapy to patients. Incomplete medical records will cause the quality of medical records at the health center to be not qualified. The purpose of this study was to determine the completeness of filling out electronic medical records for public clinics at Cipayung Public Health Center. Based on the results of the research, it is known that the percentage of completeness of filling in electronic medical records for General Clinics in January-March 2019 is 78.12%. The highest medical record is patient identity which is 100% and the lowest is a good record which is 52%, while the Completeness of Reports / Forms that are important the author's percentage is 75% and Author Authentication the percentage is 92%. Problems related to filling out electronic medical records for public clinic in Cipayung Public Health Center are electronic medical records equipped with officers after public clinic services are completed and there is no SOP which is used as a basis for filling out electronic medical records for public clinics.*

*Key words : Completeness. Electronic Medical Records, General clinic*
