ABSTRACT

Chronic Kidney Disease (CKD) is a kidney damage during more than 3 months based on the evidence of abnormal structure and function or (Glomerular Filtration Rate/ GFR) <60 mL/min/1.73 m² during 3 months with or without the kidney damage evidence (Chris Tanto, 2014). It is caused by some factors, there is blood vessel interruption kidney tissue, immunology interruption, infection, metabolic interruption, proximal tubules interruption, obstruction of tractus urinarius, and congenital disorder. The most common symptom that showed from this case is urinemia syndrome. The aim of this research is to be able in giving nursing care for CKD patients with ineffectively of breath pattern in public treatment room 4th of The Central Army Hospital Gatot Soebroto Jakarta. Research method is an analysis of case studies in accordance with the nursing action undertaken in the room based on. The result of the study were male and female, all respondents in this study amounted to three respondents who are patients CKD ON HD. The conclusion obtained is the problem of the four diagnoses that elevated excess fluid volume, 1 client (33,3%), activity intolerance 3 client (100%), nutritional imbalance less than body needs 3 client (100%), and changes in skin integrity (33,3%). Not resolved it is advisable for nurses to be able to provide comprehensive nursing care in various aspects for CKD ON HD patients, so that patients can improve their healthy status
