ABSTRACT

CKD is a state where the kidney is unable to perform its regulatory and excretory functions to maintain homeostasis and must undergo hemodialysis to maintain its life. The existence of the impact of the disease and treatment procedures that must be lived is a stressor capable of causing the occurrence of depression. It takes the role of nurse as health care provider, educator, nursing caregiver to overcome nursing problem that happened to CKD patient. The purpose of this case study is to identify nursing care in each patient with CKD disease in the General Hospital Room 6th Floor of Gatot Subroto Central Jakarta Gatot Soebroto Year 2017. In writing the final report of this case study the authors use descriptive method (with nursing process approach) and literature method (with literature search): Characteristics of patients who become respondents in case studies of CKD disease average age 41-70 years Majority of classification of clients Chronic Kidney Disease At stage V and not yet undergoing hemodialysis. Nursing nursing problems in CKD clients are excess fluid volume, changes in breath pattern, nutritional imbalance, ineffectiveness of tissue perfusion, activity intolerance, risk of skin damage, and anxiety. From the case study the authors found were patients with Chronic Kidney Disease (CKD) who, before undergoing hemodialysis therapy, complained anxiously because of pain experience in the fistula pricking area at the time of hemodialysis initiation. Prayer Therapy and Dhikr is one of the management that can be given to CKD patients who feel anxious. The results of this study indicate that there is the influence of therapy Do'a and dhzikir overcome anxiety in the client Chronic Kidney Disease (CKD). It is suggested to RSPAD Gatot Soebroto to make SOP in the action of Psychiceligious therapy of Do'a and Dhzikir to overcome anxiety in CKD patient.
