Title : Overview of The Management of The Use of a Diagnosis Abbreviation in Inpatient Medical Records in The Tangerang General Hospital

In accreditation, there are elements that mention if each hospital is trying to get, manage, and use information to improve or improve the results of patient care. Therefore, the use of a diagnosis abbreviation must be managed properly so that the doctor gives a clear diagnosis and the code gives the correct code. One of the factors that do not match the abbreviations of diagnosis with the standard book is the abbreviated house because of the lack of socialization to health care providers. Currently the Tangerang District General Hospital already has a standard abbreviation book, but there are several uses of a diagnosis abbreviation that do not conform to the standard abbreviated book. The impact of a mismatch of the diagnosis abbreviation with the standard abbreviated book will make Coder mistakenly give the disease code. This study aims to find out the description of the management of the use of a diagnosis abbreviation using the P-D-C-A (Plan-Do-Check-Action) cycle. This research was carried out in Tangerang District General Hospital, Tangerang City. Using descriptive qualitative methods. Data collection techniques in this study use interviews, observation, and literature study through informants. From the results of this study it is known that the governance of the abbreviation of diagnosis at the General Hospital of Tangerang Regency has not been well organized, because there is no evaluation and follow-up in the problem. It is recommended that the hospital can carry out an evaluation, in order to see the discrepancies in the abbreviation of the diagnosis so that there is no discrepancy and error in the coding.
