Title : Review of Quantitative Analysis of Inpatient Medical Resume

A discharge summary is a summary containing important information about the disease, examination and treatment of patients provided by health workers, especially doctors in the hospital. This study aims to quantitatively analyze medical resume forms in hospitalized patients. This type of research is descriptive and data collection techniques are observation, checklist and interview. This research was conducted at Patria IKKT Hospital in July 2018. This research was conducted using metodetatic systematic random sampling at Patria IKKT Hospital, the implementation of quantitative analysis on medical resumes was not structured, namely the absence of component 4, namely a good record. The results showed a quantitative analysis of medical resumes from 105 medical resumes analyzed, averaging 65% completeness. The highest percentage of its completeness is found in the Authors Authentication component 76.1%, while the lowest percentage is found in the Completeness of the Important Report component which is 54.7%. Especially in the length of care of 15.2 and the results of the examination amounted to 32.3%. The incompleteness of the essential components / records can result in obstruction of reporting of data and information to the patient.
