Title : Review of the Accuracy of the Diagnosis of Disease and
Disease Outpatient Acts of Eye Polyclinic at Pasar Rebo
Regional General Hospital in 2018*

The accuracy of giving a diagnosis code is very influential in indexing, reporting, and financing systems. The purpose of this study was to determine the accuracy of disease diagnosis codes and outpatient actions of eye polyclinics in Pasar Rebo Hospital in 2018. According to the coding is the activity of coding by using letters and numbers or combinations of letters and numbers that represent data components. Activities carried out in coding include coding activities for disease diagnosis and coding medical actions. This research method is a descriptive method with a sample of 94 medical records. Data collection techniques by observation and interview. The results of the study are the accuracy of coding the diagnosis and action is 84% while the inaccuracy of the coding of diagnosis and action is 16%. Factors affecting the inaccuracy of coding of diagnoses and actions are the lack of understanding of doctors and coders in implementing the applicable SPO. so the coder is incorrect in determining the diagnosis code. It is suggested to Pasar Rebo Regional Hospital that the coder should confirm to the doctor if an incomplete diagnosis is found, as well as disseminating the SPO to the doctor and coding officer (koder) so that the coding is carried out in accordance with the established SPO.
