Study Program : Medical Record and Health Information
Title : Analisa Kebutuhan Pelaksanaan Rekam Medis Elektronik
Pasien Rawat Jalan di RSUD dr. Chasbullah Abdulmadjid

6 Chapters, 77 Pages, 3 Tabels, 2 Pictures, 5 Attachments

Electronic medical record is using electronic methods for storing, processing and accessing medical record of patients in hospital that have been stored in a multimedia database management system that collects various medical data. Electronic medical record is very important for managing health-related problems through complete and accurate information about patients. EMR is very important for better health management because provides to integrity and accuracy of data in Health care organizations that are very important for the medical and law. The general purpose of this research is analysis the need for the implementation of electronic medical records for outpatient in RSUD dr. Chasbullah Abdulmadjid. The specific purpose of this research are to know the Standard Operational Procedure of electronic medical record in that hospital, identify the things that must be considered to implementation of electronic medical records, and to identify supporting and inhibiting factors in the implementation of electronic medical records. This research method is descriptive by giving description and explaining the results obtained with completely the implementation needs for electronic medical records of outpatients. The data collection technique of this research is by observation and interview. That hospital has not used electronic medical record in patient services, because the need for the implementation of electronic medical record for outpatient is still lacking. Recommend that an electronic medical record be implemented immediately to improve the quality of patient care effectively and efficiently.
