Title : Related Factors With Utilization Of Possible Posbindu In Posbindu Flamboyan Sudimara Jaya Village Tangerang City In 2019.

Advanced age is someone who has reached the age of 60 years and above. The number of people entering the elderly is increasing rapidly both in developing countries and in developed countries, this is caused by a decrease in fertility (birth) and mortality (death), as well as an increase in life expectancy (Life Expectancy) which changes the overall population structure . Hypertension is 1.13 billion people all over the world suffer from hypertension, based on WHO data in 2018 Diabetes Militus of 205 million people worldwide suffer from diabetes mellitus, Heart Disease of 1.1 billion people worldwide suffer from heart disease. As for bone and joint disease, 20% -30% of people worldwide suffer from bone and joint disease. This Research Aims To Know The Factors Associated With The Utilization Of Elderly Posbindu In Posbindu Flamboyan, Sudimara Jaya Village, Tangerang City In 2019. This study used a Cross Sectional design with a sample size of 117 respondents. Sampling in this study using simple random sampling technique and analyzed by Chi Square test conducted in May-June 2019. Based on the results of the study there is a significant relationship between knowledge P-Value (0.039), the role of P-Value cadre (0.035) and P-Value access (0.046) with the use of post-Hindu elderly. Whereas there is no significant relationship between family support and the use of post-Hindu elderly. It is expected that health workers to run the Posbindu program for the elderly will be better to increase the health status of the elderly.

Keywords: utilization of posbindu, knowledge, family support, cadre role, access
