### **ABSTRACT**

Pediatric patients with cancer are more often dependent on their parents / others. Based on several studies of the level of independence of children with less cancer data, so to boost the independence is necessary. This level of independence is the fulfillment of basic needs such as personal hygiene fulfillment such as bathing, hair care, dental care and environmental care. Need to be done so that personal hygiene child can be fulfilled independently. The aim is to see the level of independence of children with terminal cases that illness. The research method used is the observation sheet, the number of samples of 15 respondents with the technique of total sampling of all respondents sampled. The result of the research on hypothesis test of Paired Samples T-Test of significant level 10% ( $\alpha = 0,05$ ) shows  $p$ -value less than  $\alpha$  value, that is  $0,000 < 0,05$ , there is influence of nurse education about independence in personal hygiene toward child self- who suffer kaker There is an effect of education education about the independence in personal hygiene to the independence behavior of children suffering from cancer. Treatment suggestions divided by palliative care are more concerned with increasing self-reliance. Provision of education is very helpful in living a healthy life in personal hygiene
