ABSTRACT

Clients with preeclampsia are specific multiorgan disorders in pregnancy characterized by hypertension, edema and proteinuria but do not show signs of vascular abnormalities or previous hypertension, whereas symptoms usually appear after 20 weeks of gestation, women aged <20 years or> 35 years very at risk of having a pregnancy with preeclampsia, this final scientific work aims to identify methods of managing anxiety control in clients with preeclampsia at the Gatot Soebroto Army Central Hospital in 2020. Writing this scientific paper uses a case study method on 4 clients, in the form of nursing care that comprehensive. The results show that the method is effective enough to deal with the problem of discomfort in clients with preeclampsia pregnancy. It is recommended that nurses are able to provide guidance or health education about the importance of identifying the causes of pregnancy with preeclampsia
