

ABSTRACT

The development of mobile phone in the world has increased. As many as 70% of teens aged 15 to 19 years in 2010 have been using mobile phones. Today more and more mobile phones have built-in GPS. With the GPS on the mobile phone it is possible to find the place we want. Restaurants and mosques for example if we first visit to another country automatically we do not know where the restaurant and mosque are located. We also do not know which restaurants we can visit to eat. With this application is very easy to find restaurant and mosque. Software development method in application development used is RAD (Rapid Application Development) model. The choice of RAD model because the view of the developed application is a simple application and does not require a long time, RAD method is a method intended for the development of short-term software in accordance with the application developed. Expected results from the development of restaurant and mosque search applications can facilitate the community in finding halal food and places for pray.
