

ABSTRACT

Development in Technology Information is always had a very rapid changes from time to time. And in every development always provide more convenience way for peoples to doing their everyday tasks. There're lot of applications that provide peoples a simple way in doing things now. Especially in working tasks. Everyone that already been working or involved in organization certainly ever involved in discussion activity. And with today's technology discussion activity should be more effective and easy to do if we using an application for that. The making of screen share and remote access application for discussion activity is started with some observation and analysis about the discussion meeting activity that commonly done by peoples in their working environment. And then from the result of the observation and analysis the planning and design process is started with goals to make the activity become more effectives. The process started with creating some system design using UML and BPMN Diagrams. After that the making of the application split into two parts which is the making of publisher application and the making of viewer application. For the publisher will be made using JAVA and the viewer will be made using HTML and java script. Hopefully the application created will make the discussion process can be more effectives and will save more time if compared with the old process. So the workers can be more productive and work more efficiently.

Keywords : Screen Share System, Remote Access System, Discussion, Meeting, Direct Command Media.
