

**ABSTRACT**

Title : Front-End Development For Sports Venue Booking  
Name : Muhammad Jumadi  
Student ID : 20180801226  
Study Program : Computer Science

The number of Indonesians using cellphones rises each year. According to *databooks.katadata.co.id* figures, Indonesia will have the third-highest percentage of smartphone users worldwide as of 2021. According to a recent survey, 89 percent of Indonesians are anticipated to own smartphones by 2025. As a result, the author decided to take the initiative and create a program that would aid the community in making reservations and locating venues and activities close by. The front-end developer who wrote this study works on the Biem Sport app. An app called Biem Sport is intended to help venue owners expand and enhance their businesses as well as to let venue patrons make reservations, carry out searches, check in and out, and learn about local events. The Biem Sport app is intended to make it simpler for venue customers to find and take part in activities offered by venue owners nearby.
