#### **ABSTRACT**

**Background :** Hospitalization is a condition that can cause anxiety and stress at all age levels , including children , the presence / family support can affect the lives and health.

**Objective :** Known about the role of family relationships and the anxiety level of school -age children ( 6 - 12 years ) who experienced hospitalization at Pinus ward in Eka Hopsital BSD .

**Research Methodology :** Quasi designed by chi-square test , with a total sampling retrieval . Sample 54 respondents .

**Research Finding :** The result of highest value are : female gender 38 respondents (70.4%), high school education 20 respondents (37.0%), private sector employees work 25 respondents (46.3%), according to the sex of the child, female gender 38 respondents (70.4% ), mild anxiety level of the children 32 respondents (59.3%), the good role of the family 46 respondents (85.2%), with a P value = 1.000. The results of statistical tests with a P value = 1.000 in which case P value > 0,05, it means H0 is not rejected.

**Conclusion :** There is no relationship between the role of family with the anxiety levels of school age children (6-12 years) who experienced a hospitalization at the Pinus ward in Eka Hospital BSD, because the anxiety leves of school age - children in this research may be relationed by age and education factor.
