Title : **Description of the incidence of diabetic nephropathy in Prolanis participants at Indosehat Clinic 2003, Cilincing in 2023**

Background. Diabetic nephropathy is a complication of diabetes in the kidneys which can lead to kidney failure. The aim of the research was to determine the description of the incidence of diabetic nephropathy, age description, gender description, blood pressure description and smoking behavior in Prolanis Clinic Indosehat 2003 Cilincing participants. This type of research is quantitative using a total sampling technique of 35. The research location was conducted at the Indosehat 2003 Cilincing Clinic. Descriptive data analysis. Data collection was primary and secondary. Research instruments examined Hba1C levels, albuminuria, creatinine, elfg, age, gender, hypertension and smoking behavior, recorded on a form sheet. The data analyzed showed that there were 12 patients suffering from Diabetic Nephropathy (34.3%), the age of the patients was elderly: 60 - 74 years there 24 people (60%), the gender of the 22 patients who dominated in this study was male gender (62.9%), there was hypertension in the number of 5 people (14.3%) and smoking behavior there were 22 people smoking (62.9%) therefore it is hoped that the cadres and health workers of the Indosehat 2003 Cilincing Clinic will routinely provide education, counseling and reminding prolanis participants to carry out laboratory tests so that they can control, monitor and prevent various complications.

Keywords: Diabetes Mellitus (DM), Diabetic Nephropathy, age, gender, hypertension, and smoking behavior
