**ABSTRACT**

Craniotomy is a bone of the skull opening operation to remove tumors, reduce ICT, removing blood clots or stop the bleeding. Based on the highest percentage in the room, Post Op Craniotomy is 4 clinical cases. The nursing care to clients with disease Post Op Craniotomy in the Floor space Room 6 Gatot Soebroto Army Hospital in Central Jakarta in 2016. In this case study used the method with the approach of the nursing process with 5 clients with cases of Post Op Craniotomy in Surgery Room, 6th Floor Gatot Subroto Army Hospital. 5 clients most 4 clients (80%) had 56-80 years of age (20%), 5 clients all (100%) had a high school education and berpekerjaan as the Army. According to the cause found (60%) clients experience a brain tumor and (40%) clients head trauma. Assessment and nursing diagnoses and nursing actions tailored to the appropriate nursing interventions and evaluation of the associated theory. Discharge Planning is done penkes (100%). In nursing care have discovered a new discovery in the case study is to do early mobilization as a measure to cope with the fall sense of shortness of breath experienced by clients especially in fulfilling the breathing patterns of clients, and to overcome the rigidity of vulnerable motion experienced by clients that particularly in the fulfillment of barriers to physical mobility client Post Op Craniotomy. In this case the researchers suggested for health care establishments (hospitals) in doing this early mobilization needed a comfortable space in its application.
