

ABSTRACT

Dwimitra Medika Clinic is a clinic that works with a company that aims only to health care for employees in the company. Currently the clinic is considered less rapidly in patient care, other than that the management has been difficult to obtain data and information and financial services that are used as the basic for clinical evaluation. Therefore considered necessary in doing the development of patient data processing system in order to produce information in an easy, timely, and accurate, and to support the patient care more quickly.

With a field study methodology, literature review and methodology in system design can be concluded that organizational resources, organizational structure, duties and functions as well as the flow of information that being used is very supportive to the development of information systems. This can be seen in the availability of computer equipment and human resources capable of using a computer. Thus the development of information systems can improve the quality of information Dwimitra Medika Clinic of the element of convenience, timeliness, and accurate that can support the service to patients more quickly.
